RL-85-LED-CPR

POWER

1. This rechargeable spotlight can be plugged into a standard household wall outlet. The charger connects to the light at the base of the handle.
2. The charger will have a solid red indicator light when the battery is charging. Half way through charging, the indicator light will turn amber. When the light is fully charged, the indicator light will turn green.

   WARNING: While the charger is intelligent enough to back off the charger when the battery is fully charged, it is not recommended that you leave the light on the charger indefinitely. Ultimately, the heat created by the charger and the battery will degrade the components. Leaving the battery to charge for a day will not cause damage. However, leaving the battery to charge for multiple days or weeks continuously will degrade the life of the charger and the battery.
3. Charge time will vary based on remaining battery charge and battery condition. Maximum charge time is 4 hours.
4. The spotlight can be turned on while the charger is plugged in. However, the spotlight will not charge while the light is being operated.
5. This LED spotlight has a lithium ion battery. The battery can be charged as little or as much as desired without “memory” issues. Lithium ion batteries do not need to be fully drained before charging nor fully charged before continuing usage.
6. Lithium ion batteries generally will discharge very slowly while not being used. You can expect a fully charged lithium ion battery to last 9-12 months on the shelf if the light was fully charged when stored.
